

Financial Model

Multi-Segment F&B Business

Portfolio Case Study

Valeriia Evtushenko

3-statement integration / Scenario analysis / WACC-based valuation

Model Objectives & Key Questions

This model is built to stress-test the financial resilience of a multi-segment F&B business.

1. IS THE BUSINESS GENERATING ENOUGH CASH FROM OPERATIONS?

(Focus: Operating cash flow self-sufficiency)

*Italian Restaurant
Japanese Restaurant
Burger Joint, Pizzeria
Beverage Brand,
Delivery Service
Central Kitchen*

2. CAN THE BUSINESS REPAY ITS DEBT?

(Focus: Debt service coverage and liquidity risk)

3. WHAT HAPPENS IF GOVERNMENT GRANTS ARE REDUCED OR REMOVED?

(Focus: Sensitivity to funding cuts and worst-case scenarios)

Outcome: The model answers these questions through 3-statement modeling, scenario analysis, and WACC-based valuation.

Historical Context (2019–2024)

Revenue vs. Total Expenses

Total Net Income vs. Government Grants

The company was unprofitable every year from 2020 to 2022. Government Grants temporarily covered the shortfall until 2023, when the gap exceeded available funding.

Cash Flow & Sensitivity Analysis

Key Metrics (Base Case Scenario)

NPV	(21,294)
IRR	n/a
WACC	11.10%
Min Cash Covenant	500
Revolver Limit	20,000
Ending Revolver Balance	20,000
Final cash	(6,208)
Government Grants	1200

The business is not self-sustaining

NPV remains negative across every tested combination of discount rate and grant funding — the shortfall is structural, not cyclical, and cannot be resolved through funding assumptions alone

At WACC = 11.1%, NPV remains negative across all scenarios

NPV Sensitivity		Discount Rate				
		25.0%	15.0%	11.1%	10.0%	5.0%
Government Grants	0	(29,230)	(32,279)	(33,651)	(34,059)	(36,047)
	500	(24,888)	(27,381)	(28,502)	(28,836)	(30,459)
	1,200	(18,809)	(20,525)	(21,294)	(21,523)	(22,635)
	1,800	(13,598)	(14,648)	(15,116)	(15,255)	(15,929)
	2,000	(11,861)	(12,689)	(13,057)	(13,166)	(13,693)
	2,400	(8,387)	(8,771)	(8,938)	(8,987)	(9,223)

2024 Waterfall Analysis: From Revenue to Cash Drain

Visual breakdown of how operating costs and debt interest now exceed total revenue, deepening the cash drain.

The revolver reaches its limit (20,000) in August 2024 — and from that point, the company cannot cover its cash shortfall, breaching the minimum cash covenant for the remainder of the year.

Segment P&L Analysis (2024)

Breakdown of EBITDA across the 7 business units. All segments are unprofitable, confirming a structural issue.

All 7 segments are unprofitable. The largest EBITDA losses come from Italian Restaurant (3,688) and Japanese Restaurant (2,563).

Central Kitchen shows the smallest EBITDA loss (569), but this reflects its role as an internal cost center with no external revenue, not genuine profitability. Among revenue-generating segments, Beverage Brand performs best, losing 746.

Note: Analysis performed at EBITDA level (Revenue – COGS – OpEx) because D&A, interest, and grants are company-wide items without a clean segment-level allocation basis. This isolates operating performance per segment from financing/capital-structure decisions made at the corporate level.

Key Conclusions

1. The company is not self-sustaining — it relies entirely on external funding to survive.
2. All 7 business segments are unprofitable. Italian Restaurant and Japanese Restaurant are the largest loss drivers.
3. The revolver reaches its limit (20,000) in August 2024 — four months earlier than initially modeled — after which the company breaches its minimum cash covenant for the remainder of the year.
4. At WACC = 11.1%, NPV remains negative across every scenario tested. The business cannot generate value for its investors under any modeled assumption.

This is not a temporary problem. This is a structural business failure.

Thank you for your time!
